

functions overview

General

- Simple, intuitive and user-friendly interface
- Save and use printing configurations
- Includes a real ink consumption utility
- Total control of printer capabilities
- Powerful postscript interpreter
- Spot color detection and replacement
- Color substitution possibilities
- Proof print option
- Supports most graphic file formats
- Direct rip and print possibilities
- Auto-update through the internet

Editing tools

- Multiple undo, configurable
- Quick viewing and zooming buttons
- Allows rotation, mirroring, scaling, cropping
- Multi-design page layouting
- Very fast design multiplicate tool
- Automatic or user-definable nesting functions
- Automatic or user-definable panelling
- Color chart generator

Printing control

- Support of direct to printhead color modes
- Add printing information and crop marks
- Printer connections via TCP/IP, USB, Firewire, etc.
- Print-to-File support for specific printers
- Easily select paper sizes in sheets and roll printing
- numerous hotfolders available
- Queue manager and printing control

specifications

Supported operating systems

Microsoft Windows 2000
Microsoft Windows XP
Microsoft Windows Vista
Microsoft Windows 2003 Server

nèoStampa is optimized for multi-core processors

Supported printers

Aiona, Almiotek, Atex, ATPColor, Canon, DGI, Encad, Epson, dGen, Dupont, Graphtec, Hollanders, HP, Ichinose, Keundo, Konica-Minolta, La Meccanica, Mimaki, MS, Mutoh, Reggiani, Robustelli, Roland, Tschudi Technology

see actual list of printer models on www.neostampa.com

Supported file formats

Image formats (BMP, RLE, TIF, JPG, PCD, PSD)
Vector/combined formats (EPS, PS, AI, PDF)
Multichannel formats (DCS, DCS 2.0, PSD)
Layout formats (CP4, CP5)

Supported color spaces

RGB (detects embedded profiles)
CMYK (detects embedded profiles)
Grayscale (detects embedded profiles)
LAB (CIELAB D50, 2°)

Supported spectrophotometers

Avantes Spectrocam
GretagMacbeth Spetrolino/SpectroScan
GretagMacbeth EyeOne Pro
Xrite DTP 32
Xrite TDP 41
Xrite DTP 51

color management

hueman CMS

Color management engine with full ICC compliance

The innovative color management engine supports almost any ink combination and allows multicolor calibration through ICC RGB profiles. Supports full soft-proof capabilities and in-gamut processing in various image processing software.

Print what you see with hueman CMS!

Supported inks are:
Cyan, Magenta, Yellow, Black, Golden Yellow, Orange, Red, Violet, Blue, Green, Gray, Light Gray, Light Cyan, Light Magenta, Second Colors

Color control

Ink control and linearization

In digital printing it is very important to control ink usage given that printing is usually performed with far lower ink levels than in conventional printing. nèòStampa permits controlling ink levels in printing in a fast and simple manner and for multichannel printing systems, to linearize the response of each color channel independently.

The full 16-bit color, linearization and raster algorithm provides highest quality results with smoothest shades and gradients.

Color calibration wizard

By help of the easy-to-use color calibration wizard individual calibrations can be done from scratch.

The wizard contains printing parameters, ink cutting, linearization and ink limiting possibilities. In combination with **neoprofiler** or any other third-party ICC RGB profiling system a complete calibration can be done giving highest color accuracy and best results.

textile printing

Step & Repeat

Seamless step & repeat printing for real textile requirements

nèòStampa offers all requirements to create a seamless step & repeated print of a design.

The specially developed algorithm calculates the best correspondence of the last and first pixel of the design to be repeated in all direction. Only with this a real seamless, high-quality printout can be achieved.

Use a fix offset (1/2, 1/3, 1/4, etc.) or an individual drop in vertical or horizontal direction showing it quickly and directly on the rapport layout.

By help of the minimal rapport option one single repeat will be processed and interpolated for high-speed printing.

Color chart generator

Generate individual color charts

nèòStampa provides a color chart generator to create and print color libraries. Variations around a desired color with a specific amount of patches can be defined and the generator automatically produces variations.

In addition to this it's possible to set 4 corners with device color data in order to be able to cover all the gamut of the printer using it's direct device channels.

In combination with nèòColorations you can also use the RGB or LAB color libraries that come with the plugin solution of Inèdit which is perfectly working with nèòStampa and the hueman CMS.

productivity

Color Substitution

Spot color detection and automatic replacement

nèòStampa automatically detects spotcolor objects in PDF/AI/EPS documents and reassigns the correct LAB value in order to achieve best color-matching results.

Furthermore in nèòStampa it's possible to select a specific color from the design and modify it by assigning a LAB, RGB or CMYK value or even to modify each printhead's color value.

It also permits to read a color by using a spectrophotometer to achieve the exact matching of the measured color.

Workflows

Color-managed workflows

nèòStampa detects embedded profiles and is able to distinguish between incoming RGB, CMYK, LAB and Grayscale data.

The possibility to set rendering intents for image, vector and spot color objects individually for the selected output profile provides full control and best result for any type of designs.

Hotfolders

With nèòStampa it's possible to define a numerous quantity of hotfolders containing information of the printing scheme. By help of hotfolders workflows can be completely automated in order to reach highest level of productivity.

Define input and output parameters, nest automatically, set trigger options and archive the original data if required. Ready? Go.
